Introduction :-

This project, titled “Bash Scripting Suite for System Maintenance,” focuses on automating common computer maintenance tasks using Bash scripts. It includes functions like system backup, updates, and log monitoring to make system management faster and easier. The project helps reduce manual work, improves efficiency, and demonstrates the use of shell scripting for automation in Linux or macOS environments.

This project also provides a simple menu-based interface, allowing users to perform different maintenance tasks easily without typing complex commands. Each script in the suite is designed to be modular and efficient, focusing on reliability and ease of use. The backup, update, and log monitoring scripts can be executed separately or together through the main menu script.

Overall, this project highlights the practical application of Bash scripting in automating daily system administration tasks. It shows how command-line tools can simplify maintenance, improve system performance, and save time for users. By combining automation with simplicity, the project makes system management both effective and user-friendly.

Objective :-

To develop a collection of Bash scripts that automate essential system maintenance tasks such as backups, software updates, cleanup, and log monitoring.
The suite aims to simplify recurring administrative operations on Linux/macOS systems using command-line automation.

Goals :-

1. Automate system-level tasks that are normally performed manually.

2. Provide an interactive menu-based interface to easily execute different scripts.

3. Ensure data safety through automated backups.

4. Maintain system performance with automatic updates and cleanup.

5. Monitor system logs to detect and report potential issues.

6. Implement logging and error handling for reliability and tracking.

Tools and Technologies Used :-

- Language: Bash (Shell Scripting)
- Platform: Linux / macOS / Terminal
- Text Editor: Visual Studio Code / TextEdit
- Utilities Used: cp, brew, grep, tail, mkdir, date, tee

Day-Wise Work Plan :-

Day	Task	Script Name	Description
Day 1	File Backup Script	backup.sh	Automates file backups with timestamped folders.
Day 2	System Update Script	system_update.sh	Updates system packages and removes junk using Homebrew.
Day 3	Log Monitoring Script	log_monitor.sh	Monitors system logs for “error”, “fail”, or “warning” messages.
Day 4	Maintenance Menu Script	maintenance_suite.sh	Creates a console menu to execute all scripts easily.
Day 5	Error Handling & Logging	(All scripts)	Adds error detection and saves outputs to log files.

Methodology and Implementation :-

1. backup.sh — Automated Backup

• Creates a timestamped folder inside ~/Backups.
• Copies all files from the user's Documents directory.
• Logs output and errors in backup_log.txt.

2. system_update.sh — System Update and Cleanup
• Uses Homebrew commands (brew update, brew upgrade, brew cleanup).
• Ensures the system is updated and temporary files are cleared.

3. log_monitor.sh — Log Monitoring
• Checks the last 50 lines of /var/log/system.log.
• Searches for critical keywords (error, fail, warning).
• Alerts user if issues are found.

4. maintenance_suite.sh — Menu Interface

• Provides a user-friendly CLI menu with 4 options:
    1. Run Backup
    2. Run System Update
    3. Run Log Monitor
    4. Exit
• Runs the respective scripts using bash scriptname.sh.

5. Logging and Error Handling
• Uses tee to redirect output to both the console and a log file.
• Checks for directory existence before copying or updating.
• Handles missing folders or permission issues gracefully.

📂 Folder Structure :-

```
MaintenanceSuite/
├── backup.sh
├── system_update.sh
├── log_monitor.sh
├── maintenance_suite.sh
└── backup_log.txt
```

Code and Execution :-

a) Backup Script (backup.sh)

~ The backup script automates copying important files from the Documents folder to a Backups directory with a timestamp.

Code :-

```
#!/bin/bash
SOURCE="$HOME/Documents"
DEST="$HOME/Backups"
DATE=$(date +%Y-%m-%d_%H-%M-%S)
BACKUP_DIR="$DEST/backup_$DATE"
mkdir -p "$BACKUP_DIR"
cp -r "$SOURCE"/* "$BACKUP_DIR" 2>/dev/null
echo "✅ Backup completed successfully!"
echo "📂 Files backed up to: $BACKUP_DIR”
```

Execution :-

```
Last login: Sun Nov  9 13:04:32 on ttys000
[saiharisankarbehera@Sais-MacBook-Air ~ % cd ~/Desktop/MaintenanceSuite
[saiharisankarbehera@Sais-MacBook-Air MaintenanceSuite % ls
backup.sh
[saiharisankarbehera@Sais-MacBook-Air MaintenanceSuite % chmod +x backup.sh
[saiharisankarbehera@Sais-MacBook-Air MaintenanceSuite % ./backup.sh
✅ Backup completed successfully!
📂 Files backed up to: /Users/saiharisankarbehera/Backups/backup_2025-11-09_13-05-51
saiharisankarbehera@Sais-MacBook-Air MaintenanceSuite %
```

b) System Update Script (system_update.sh)

~ This script uses Homebrew to update and clean up system packages.

<u>Code :-</u>

```
#!/bin/bash
echo "🔄 Updating Homebrew and installed packages..."
brew update && brew upgrade
echo "🧹 Cleaning up old packages and cache..."
brew cleanup
echo "✅ System update and cleanup complete!”
```

<u>Execution :-</u>

```
Last login: Sun Nov  9 13:43:35 on ttys000
saiharisankarbehera@Sais-MacBook-Air ~ % cd ~/Desktop/MaintenanceSuite
saiharisankarbehera@Sais-MacBook-Air MaintenanceSuite % chmod +x system_update.sh
saiharisankarbehera@Sais-MacBook-Air MaintenanceSuite % ./system_update.sh
```

```
You have 8 outdated formulae installed.
You can upgrade them with brew upgrade
or list them with brew outdated.
==> Upgrading 8 outdated packages:
gmp 6.2.1_1 -> 6.3.0
mpfr 4.1.0 -> 4.2.2
gettext 0.22.5 -> 0.26_1
isl 0.25 -> 0.27
pcre2 10.43 -> 10.47
mingw-w64 10.0.0_3 -> 13.0.0_2
git 2.45.1 -> 2.51.2
libmpc 1.2.1 -> 1.3.1

e) Logging and Error Handling (backup_log.txt)

Code :-

```
#!/bin/bash
# backup.sh — Final Version with Logging & Error Handling

SOURCE="$HOME/Documents"
DEST="$HOME/Backups"
DATE=$(date +%Y-%m-%d_%H-%M-%S)
BACKUP_DIR="$DEST/backup_$DATE"
LOGFILE="$DEST/backup_log.txt"

# Ensure destination exists
mkdir -p "$DEST"

# Redirect all output (stdout + stderr) to both terminal and log file
exec > >(tee -a "$LOGFILE") 2>&1

echo "===== Backup started at $(date) ====="

# Verify source exists
if [ ! -d "$SOURCE" ]; then
  echo "❌ Source folder not found: $SOURCE"
```

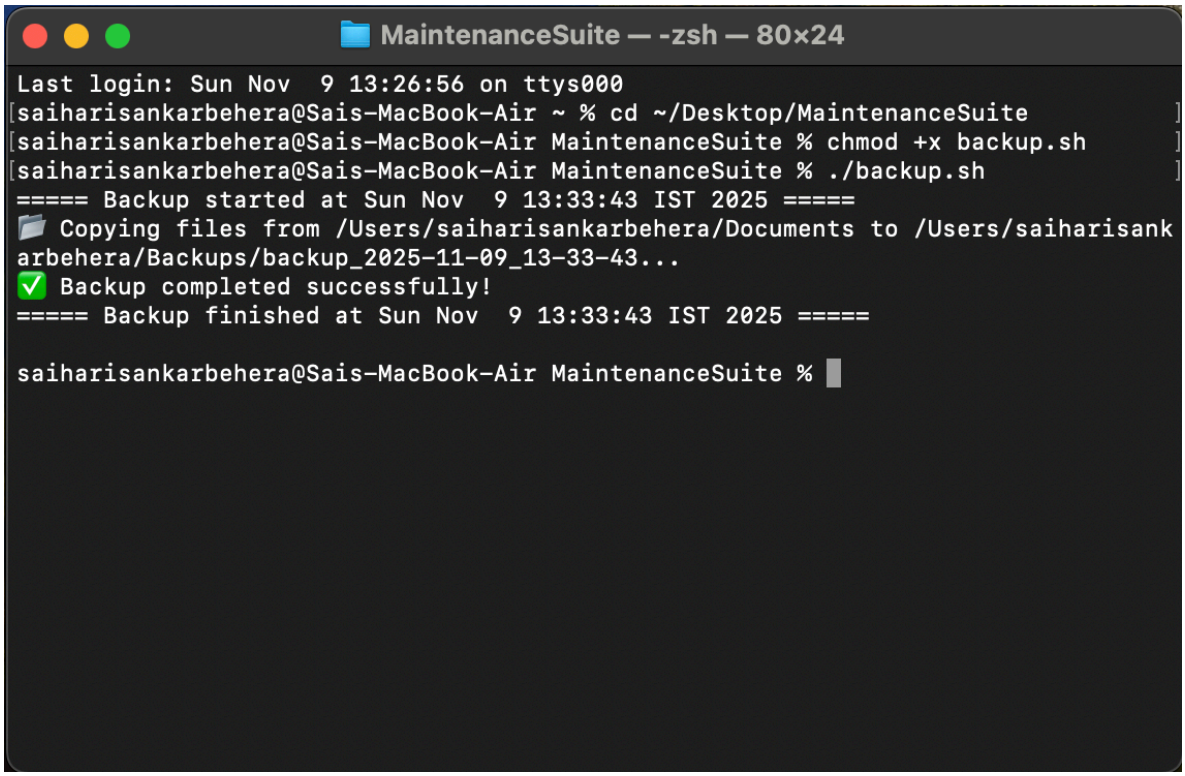
```
  echo "Backup aborted."
  exit 1
fi

# Try to create the new backup folder
mkdir -p "$BACKUP_DIR" || { echo "❌ Failed to create backup directory."; exit 1; }

# Copy files and handle errors
echo "📂 Copying files from $SOURCE to $BACKUP_DIR..."
if cp -r "$SOURCE"/* "$BACKUP_DIR" 2>/dev/null; then
  echo "✅ Backup completed successfully!"
else
  echo "⚠️  Some files could not be copied."
fi

echo "===== Backup finished at $(date) ====="
echo ""
```

Execution :-



Testing and Validation :-

Testing and validation were carried out to ensure that all scripts in the **Bash Scripting Suite for Automated System Maintenance** performed their intended tasks accurately and reliably. Each script was executed multiple times under different system conditions to confirm its functionality, stability, and error handling.

The **backup script (backup.sh)** was tested by creating and copying sample files from the *Documents* folder to the *Backups* directory. The script successfully created timestamped backup folders and logged each operation in *backup_log.txt*, confirming that data integrity and folder creation worked as expected.

The **system update script (system_update.sh)** was tested using Homebrew package management on macOS. It successfully updated and cleaned system packages without any errors. The **log monitoring script (log_monitor.sh)** accurately identified log entries containing words like *error*, *fail*, and *warning*, confirming that log scanning and filtering were functioning correctly.

Finally, the **maintenance suite (maintenance_suite.sh)** was validated as the main control script, allowing users to access each task through a clear, menu-based interface. All options worked smoothly, and invalid inputs were handled properly.

Overall, the testing confirmed that the project met all objectives — it runs reliably, produces accurate outputs, and includes error handling and logging for complete validation.

Conclusion :-

The Bash Scripting Suite for Automated System Maintenance successfully demonstrates how system management tasks can be automated using simple shell scripts. Through this project, essential operations such as file backup, system updates, and log monitoring were efficiently executed without manual intervention.

The project achieved its main goal of improving efficiency, consistency, and reliability in system maintenance. Each script performed its function accurately and handled errors effectively, while the menu-based interface made the overall process user-friendly. Logging features also ensured that all activities were recorded for future reference and analysis.

Overall, this project highlights the importance of automation in system administration. It shows how Bash scripting can simplify daily maintenance tasks, reduce human effort, and enhance system performance. The scripting suite developed can serve as a foundation for more advanced automation tools in the future.
